Concerning section V.

1. A coupling system for transfer of an anaesthetic liquid from a bottle to a vaporizer as defined in claim 1 is disclosed in EP-A-1 304 132.

The problem of the invention was to provide a coupling system which ensures that no or only a negligible spill of liquid occurs when the bottle is coupled with or removed from the vaporizer.

This problem is solved in that the seal of the bottle part abuts sealingly against the second reactive body, and the seal of the vaporizer part abuts sealingly against the first reactive body when the bottle part and the vaporizer are coupled or decoupled.

These features are novel and they cannot be derived in an obvious manner from the cited documents.

Moreover, such an apparatus is industrially applicable such that all the requirements of Art. 33(2)-(4) PCT are met.

2. The dependent claims 2-4 define particular embodiments of the invention according to claim 1. Thus, these claims also meet the requirements of Art. 33(2)-(4) PCT.

3. The method specified in the independent claim 5 comprises the same special technical features as claim 1. Thus, it meets the requirements of the PCT for the same reasons as set out above with respect to claim 1.

4. The dependent method claims 6-7 define particular embodiments of the invention according to claim 5. Thus, these claims also meet the requirements of Art. 33(2)-(4) PCT.
